Figure 1. The effect of the number of trials on the number of correct responses. The number of correct responses was plotted against the number of trials for each condition. The number of correct responses increased with the number of trials for all conditions. The number of correct responses was highest for the condition with the highest number of trials (10 trials) and lowest for the condition with the lowest number of trials (2 trials).

| Age Group | Percentage |
|-----------|------------|
| 18-24     | 10         |
| 25-34     | 35         |
| 35-44     | 25         |
| 45-54     | 15         |
| 55-64     | 10         |
| 65-74     | 5          |
| 75-84     | 2          |
| 85+       | 1          |

[illegible]

| Age Group | Percentage |
|-----------|------------|
| 18-24     | 10%        |
| 25-34     | 15%        |
| 35-44     | 20%        |
| 45-54     | 25%        |
| 55-64     | 20%        |
| 65-74     | 15%        |
| 75-84     | 10%        |
| 85+       | 5%         |

Figure 1. The effect of the number of trials on the number of correct responses. The number of correct responses was significantly higher for the 10 trials condition than for the 5 trials condition. Error bars represent the standard error of the mean.

Diagram illustrating the schematic representation of the protein structure of the C-terminal domain of the human protein. The structure shows a series of alpha-helices and beta-strands. A yellow bar highlights a specific region, and a green bar highlights another. The sequence is labeled with 'X' and 'W'.
