Abstract The purpose of this study was to determine whether there were differences in the prevalence of self-reported depression between men and women who had been exposed to violence by intimate partners. Data from the National Longitudinal Study of Women's Health are used. Results show that among women who reported being sexually abused by their current or former partner, 10% reported having experienced depression during the past year compared to 6% of those who did not report sexual abuse. Among women who reported physical abuse by their current or former partner, 17% reported experiencing depression during the past year compared to 8% of those who did not report physical abuse. These results suggest that exposure to violence by intimate partners is associated with higher rates of self-reported depression.
